

## St. Clair Transmission Line

### We want to hear from you!

Southwest Ontario is growing and needs access to more electricity. Hydro One is supporting this growth by bringing more power to the region through a network of projects, including the new St. Clair line.

The St. Clair project involves the construction of a new double-circuit 230 kilovolt transmission line between our Lambton Transformer Station and Chatham Switching Station. We're completing a class environmental assessment for the project and are looking for your feedback to help us select a preferred route that balances the natural environment, socio-economic environment and technical considerations.

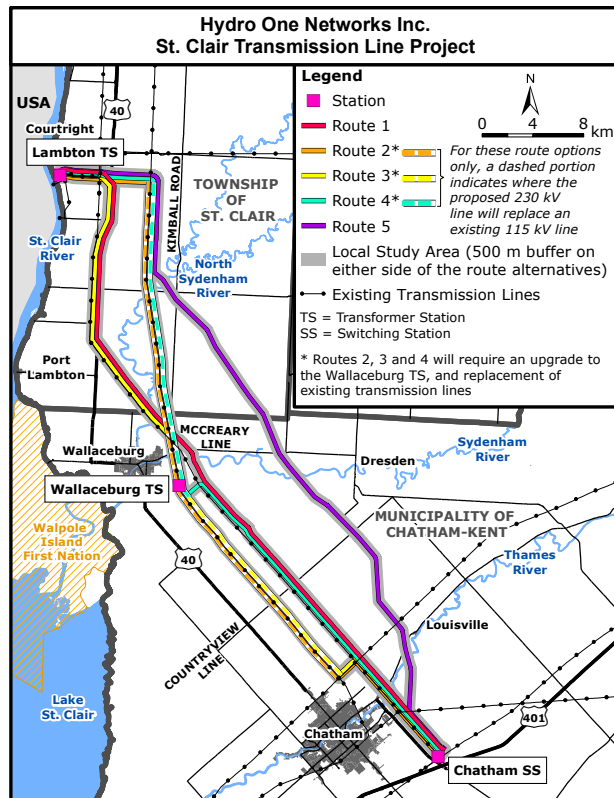

# We look forward to seeing you!

This Fall, we are planning to host various engagement opportunities and hope to see you in-person or through our virtual community open houses. Over the coming weeks we will send an invitation with more details.

In the meantime, please contact us with any questions or feedback you may have about the project. Your input is important to us!

Contact Community Relations to join our project contact list and visit our project website to stay updated.
